

Public benchmarks: wins in two event-data domains (7 October 2026)

One model family — persistent memories that decay and rotate with elapsed time, sparse addressed writes and temporal races — now wins public leaderboards of two kinds: temporal point processes (EasyTPP, ICLR 2024) and irregular clinical records (P19). Every row is a sealed test on the official splits under a pre-registered protocol.

Benchmark (public, official splits)	Ours (sealed test)	Best published	Verdict and compute
EasyTPP Taxi (nats/event, higher better)	0.5250 ± 0.0010; 5-seed mixture 0.5363	0.522 ± 0.004 (S2P2)	Win, 5 seeds. Single model at 1/12 of S2P2's parameters and compute; mixture beats every published model at 0.41×.
EasyTPP Taobao	1.3991 ± 0.0025	1.318 ± 0.017 (IFTTP)	Win, 5 seeds: +0.081 nats/event at 0.92× S2P2 per-event compute.
EasyTPP StackOverflow	-2.1525 ± 0.0045 (matched size)	-2.163 ± 0.009 (S2P2)	Win at matched compute, 5 seeds: 0.968× parameters, 1.015× per-event compute.
EasyTPP Amazon	0.7839 ± 0.0265	0.781 (S2P2)	Mean ahead at 0.29× compute; not confirmed (one low-basin seed).
P19 sepsis (ICU records)	AUPRC 0.639 ± 0.039; AUROC 0.916 ± 0.022	AUPRC 0.583; AUROC 0.903 (MTM)	Win, five splits: AUPRC beyond both split spreads; 62,681 parameters.
P12 mortality (ICU records)	AUPRC 0.585; AUROC 0.871 ± 0.011	AUPRC 0.586; AUROC 0.880 (MTM)	Behind MTM on AUROC, level on AUPRC; ahead of all other published models.

Three of five EasyTPP datasets are won, two at a fraction of the state of the art's compute and one at matched compute; the P19 classifier uses the same temporal memory layer. The Taxi, Taobao and StackOverflow wins pass the recording-grid audit and hold under the EasyTPP/S2P2 Monte Carlo estimator.

In development, reported as such: Retweet (TEST protocol), PAM, and the sealed FAS v2 benchmark on anonymous interleaved logs (in development: best v2 validation AUROC .663 (C2) vs best anonymous classical .685; round 2 (recording-cell likelihood) running).

Source-bound packet: report/public_wins_headline_evidence_20261007_v1.json (own numbers computed from the result files; published references and compute ratios from experiments/B1_EASYTPP.md and experiments/B2_IRREGULAR_TS.md). All earlier pages, including the 6 October cross-domain page, are retained.
